

Laboratory 0: PRELIMINARY STEPS

1 Download software

We will usually work with virtual machines (VirtualBox). We need two for the time being. Both running with Ubuntu MATE 22.04. So if you didn't before you must download:

- Last version of VirtualBox
- Ubuntu MATE 22.04

2 Installing software

- Install VirtualBox.
- Create a VM named "Ubuntu Server" and install Ubuntu.

3 Cloning virtual machines

To achieve the second VM you can repeat the second part of step Installing software or you can clone Ubuntu server. The name of the second VM will be "Ubuntu Client". If you clone it, keep in mind that two VM cannot have the same MAC. Be sure you check the box for this purpose (If you forget this, you can change it later).
